We believe that our patent falls under 37 CFR. 1.102 under category V Environmental Quality. And would like this petition to be accorded "special" status. This machine and process are designed to enhance the quality of the environment of mankind. This invention contributes to the restoration and maintenance of air a life sustaining element, by removing, neutralizing and disposing of particulate, germs and bacteria in the air. As well as having a system that will detect and recognize toxic and noxious gases and radiation detection. This system provides a automatic safety shut off that would trigger an audible and visual alarm as well as a charcoal filter that would be able to absorb gases that may have leached beyond the gas detection system this would contain the harmful element until it could be addressed. This is a very thorough invention and we would like it to be accorded "special" status.

A handwritten signature in black ink, reading "Adria Valley Anne Nelson". The signature is written in a cursive, flowing style.
